

While we havent showcased the tabbed modules available on this demo they are still available for use. The tabs and their triggers appear on the page when you publish any module to the Tab1, Tab2, Tab3 or Tab4 position and the tab trigger titles are controlled in the template parameters. You can publish up to four individual modules to each tab position.

### **I'm a Heading 3 Title**

Zen Grid compatible templates have the ability to transform standard Joomla modules into sliding accordion-like modules. The sliders are initiated by simply adding the module class suffix -slide to the module. Once you have done that the title of the module becomes the trigger which either hides or displays the module content via a smooth jQuery transition.

For more information regarding the slide module class suffix and step by step tutorials on how to apply the module class suffix please visit the [Zen Grid Framework knowledgebase](#) .

### **I'm a Heading 3 Title**

The text for the triggers are controlled by our the template administrator as per the screenshot below. The these settings can be found in the news stream template parameters under the extra scripts and performance > hidden panel settings.

Please note in the next major release of the Zen grid framework tabs and slides will be a core feature of the Zen Grid Joomla template framework.

## Tabbed Area Settings

The following values control the titles of the triggers for the tabbed modules. In order for these titles to appear you need to make sure that at least one module is published to the tab1, tab2, tab3 or tab4 positions.

If you would like to disable the tabbed then make sure there are no modules published to these positions.

Tab1 Title Trigger

Tab1

Tab2 Title Trigger

Tab2

Tab3 Title Trigger

Tab3

Tab4 Title Trigger

Tab4

**Figure 1.10** This figure is a screenshot of the Article Menu settings page. It shows the 'Tabbed Area Settings' section, which includes a table with four rows. Each row has a label for a tab title trigger (Tab1, Tab2, Tab3, Tab4) and a corresponding input field containing the same label. The text above the table explains that these values control the titles of the triggers for the tabbed modules and that at least one module must be published to each tab position for the titles to appear. It also states that if the tabbed area is to be disabled, no modules should be published to these positions.
